

It's a 'Darkfield police station,' HC raps Whitefield cops

Censures higher-ups over repeated illegal arrests

AMBARISH B
BENGALURU, DHNS

Change the name from Whitefield to 'Darkfield' police station, the high court of Karnataka observed on Saturday while hearing a matter pertaining to the illegal arrest executed by the Whitefield police.

Censuring the higher-ups in the police department over consecutive pleas alleging illegal arrests, Justice M Nagaprasanna directed the state DGP and IGP to issue guidelines on procedures to be followed pursuant to issuance of a notice under BNSS section 35(3).

"Is this the way to exercise police powers? A court

should tutor you? Uniform does not give you license to act however you want. We are governed by the rule of law, not the rule of men. Whoever may tell you anything, you are under the rule of law," Justice Nagaprasanna orally told the senior officers who were present in the court.

The court posed a series of questions to Saidulu Adavat (DCP Whitefield), Reena Suvarna N (Assistant Commissioner of Police), Preetham (investigating officer).

The court asked if they were aware of the Apex Court judgement on power of arrests after issuance of notice under section 35 (3), asking to appear before the Investigating Officer.

Kunal Kamra show

The petitioner Mohan Gowda, who represents an organization called Hindu Rashtra Samanvaya Samiti, was taken into custody in Udupi and served with a notice under section 35 (3), asking to appear before the IO, just a few yards away from the police station.

Mohan Gowda had petitioned against comedian Kunal Kamra's show at Uru in Whitefield. After the show was cancelled, he posted on social media stating that the cancellation was a victory for Hindu unity.

The Whitefield police registered a suo motu FIR based on the complaint by a constable for offences primarily under BNS section 353(2) for spreading false information/rumours with the intent to create hatred or hostility between different communities. Mohan Gowda was later released as his advocates intervened.

The court said the police power is not a charter for police absolutism. "Power to arrest cannot become an instrument of oppression and authority to enforce the law employed to circumvent the law itself. The uniform that an ordinary man would wear to become a policeman cannot confer immunity from constitutional discipline. Every coercive power of the police carries within it a corresponding obligation to exercise that power fairly, reasonably and for the purpose for which it is conferred," Justice Nagaprasanna said.

The court has directed the state police chief to issue guidelines that police officers, irrespective of the rank, to follow the Apex Court judgements (Satender Kumar Antil and Nalla Balu cases), failing which they will face the departmental enquiry besides being mulcted with exemplary costs when

such cases are brought before the high court.

The high court observed that the Whitefield Police Station appears to have been violating the law time and again. The court said there have been repeated instances of illegal arrests by the Whitefield police.

The court cited another matter before a different bench in which the court ordered enquiry after the Whitefield police failed to produce CCTV footage of a particular date citing power outage and non-functioning of UPS.

"The acts of the policemen manning this police station has been the subject matter of several proceedings before this court or the coordinate bench of this court where the Apex Court judgement is being violated in impunity. The DGP and IGP, as the head of the police force, cannot be oblivious to what is happening in the police stations in the state, including the city," Justice Nagaprasanna said.

Cloud seeding: Govt forms two committees

BENGALURU, PTI: The state government has constituted two separate committees to ensure the smooth implementation, monitoring and technical guidance of the cloud seeding.

The programme has been undertaken to address rainfall deficit and drought-like conditions in the state, with the objective of providing maximum benefit to standing crops through appropriate use of advanced technology, officials said.

An order was issued on August 28 for constitution of the two committees - Monitoring Committee and Technical Advisory and Evaluation Committee.

The committees will work towards ensuring the scientific implementation of cloud seeding operations and their effective execution in areas facing rainfall deficiency, officials said.

They said the project is estimated to cost Rs 28.52 crore and will be carried out for 60 days (approximately 200 hours of operations). Flights will operate between 8 am & 6 pm daily.

Kothanur residents wade through sewage, broken roads

Evergreen Layout in Kothanur with sewage overflowing onto the damaged main road, making it difficult for pedestrians and commuters to navigate the stretch.

ASHWIN B M
BENGALURU, DHNS

Residents of Evergreen Layout main road in Kothanur have been negotiating damaged roads, overflowing sewage and inadequate street lighting for several months, struggling to navigate the stretch.

They said the road has remained in poor condition for nearly seven to eight months, while sewage has been overflowing for the past two months. They alleged that repeated patchwork and poor-quality civic works have failed to provide a lasting solution.

"The deplorable condition has dragged on for months, with sewage overflowing for the last two months. Every year, the infrastructure suffers damage because of poor-quality work," said Ashish, a resident of Evergreen Layout.

Residents also pointed to a lack of coordination between the Greater Bengaluru Authority (GBA) and the Bengaluru Water Supply and Sewerage Board (BWSSB). Confusion over jurisdiction between the KR Puram and Mahadevapura constituencies, they said, has further delayed action.

Aneesh Varghese, another

resident, said the road was earlier a layout road before being taken over by the government, but alleged that maintenance has been scant since.

For residents, the sewage problem has become an everyday ordeal. "It has been a full month of continuous drainage leakage. Children and residents have to walk through the foul stench every day," said Benny CV, a resident. He also complained about non-functional streetlights, saying vehicles often splash sewage water on pedestrians at night. Residents have urged the civic authorities to fix the drainage system, restore the road and ensure functioning streetlights at the earliest.

A senior official with GBA, who is in charge of the area, said that coordination with different civic agencies, such as BWSSB and Bescom, is the biggest challenge.

"Sewage overflow comes under the BWSSB's purview. Contractors in charge must fix the problem, but they are delaying it, and the road will inevitably be damaged by continuous stagnant water. There should be a mechanism for seamless coordination. We will look into this issue and try to resolve it at the earliest," said the official.

JNCASR research finds unusual wave-like heat transport in crystalline solids

ASRA MAVAD
BENGALURU, DHNS

Researchers at the Jawaharlal Nehru Centre for Advanced Scientific Research (JNCASR), Bengaluru, have found an unusual way in which heat moves through a crystalline material, a finding that could help in developing more efficient technologies to convert waste heat into electricity.

The study, published in the *Science Advances* journal, examines a copper-based material called TiCu5Se3.

The researchers found that, unlike the conventional understanding of heat moving through a crystal, heat in this material is transported predominantly through wave-like

behaviour of phonons, which are tiny vibrations that carry heat through a solid.

In simple terms, heat in most crystalline materials is understood to move somewhat like particles travelling through a medium. But in TiCu5Se3, the researchers found that the material's complicated internal structure causes this picture to break down.

Copper atoms inside the material are able to move locally, but are confined to specific regions rather than freely travelling through the structure. This creates strong disorder and unusual vibrations in the crystal.

Professor Kanishka Biswas, who led the research team, described the material's struc-

ture as a complex, knot-like framework.

The restricted movement of copper atoms creates what scientists call strong anharmonicity. Essentially, the atoms do not vibrate in the simple, regular manner expected in an ideal crystal.

These vibrations interact strongly with one another, allowing heat to be carried through wave-like coherence between different vibrational modes.

This is important because the material has an exceptionally low ability to conduct heat through its lattice. Its lattice thermal conductivity was measured at about 0.3 to 0.2 watts per metre-kelvin between 294 and 673 K. At the same time,

it retains good electrical transport properties, which are both important for a good thermoelectric material.

Thermoelectric materials can convert a temperature difference directly into electricity. This means they can potentially be used to recover electricity from waste heat produced by industrial machinery, vehicles and other systems.

The researchers achieved a thermoelectric figure of merit, or zT, of about 1.42 at 673 K in the original material. By introducing a small number of copper vacancies, they increased this to about 1.7 at the same temperature.

The significance of the study, however, goes beyond this particular material.

Conventional approaches often try to reduce heat conduction by making ions highly mobile, but excessive movement can destabilise a material. Here, the researchers show that ions can instead be kept within confined regions while still creating the strong vibrations needed to suppress heat transport.

This could provide a new design strategy for thermoelectric materials, materials that conduct electricity well but prevent heat from passing through easily.

"While this could aid in mid-temperature range energy conversion, such as steel and thermal power plants, and even in car and bike exhaust pipes. Specifically, it can help

data centres which produce a lot of waste heat. This kind of material, which is an extremely low thermal conductor and has a high thermoelectric figure of merit, can convert the waste heat from data centres into electricity," explained Biswas.

He also added that such a material can also be used in quantum technologies.

"One of the main concerns when it comes to quantum technologies is fear of losing information due to thermal decoherence. Ultra-low thermal conductors like TiCu5Se3 can be used as a shield or a platform for quantum technology," he explained.

The research team included PhD students Sayantoni Choudhury and Animesh Bhui.
